Explosion-proof Electromagnetic Flowmeter
LDG-SUP-A100D

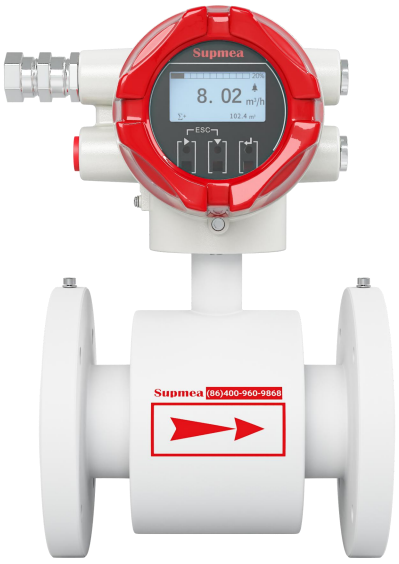
The electromagnetic flowmeter is designed based on the Faraday electromagnetic induction principle and used to measure the instantaneous flow rate of conductive liquids in enclosed pipelines in flammable and explosive environments. During on-site monitoring and display, standard current signals, pulse signals, and RS485 digital signals can be output for recording, adjustment, and control, achieving automatic detection and control. It can be widely used in industries such as tap water, chemical industry, coal, environmental protection, light textile, metallurgy, papermaking, etc.

Features

- Passed various universal explosion-proof (Ex) certifications.
- Reliable measurement, high accuracy, and good stability.
- Integrated structure, no moving parts, easy to install, maintenance free.
- RS485 communication interface - standard Modbus RTU protocol.
- It is not affected by the direction of the fluid and can be accurately measured in both directions.
- Adopting advanced low-frequency square wave excitation, zero point stability,strong anti-interference ability, and reliable operation.
- Touch the button, no need to open the lid operation.
- The orientation of the header/display interface can be adjusted for easy reading.
- Built in bilingual Chinese and English, allowing for free switching.



Explosion-proof Electromagnetic Flowmeter

Principle

The operating principle of electromagnetic flowmeter is based on Faraday's law of electromagnetic induction. The two electromagnetic coils at the upper and lower ends as shown in Figure 1 generate a constant or alternating magnetic field. When the conductive medium flows through the electromagnetic flowmeter, the induced electromotive force can be detected between the left and right electrodes on the wall of the flowmeter tube. The magnitude of the induced electromotive force is proportional to the electrically conductive medium flow rate, the magnetic induction density of the magnetic field, and the width of the conductor (the inner diameter of the flowmeter measuring tube), and the flow rate of the medium can be obtained by calculation. The induced electromotive force equation is as follows:

$$E = K \times B \times V \times D$$

Where: E—Induced electromotive force

K—Meter constant

B—Magnetic induction density

V—Average flow speed in cross-section of measuring tube

D—Inner diameter of measuring tube

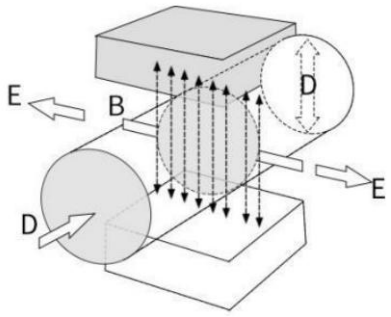


Figure 1

When measuring the flow, the fluid flows through a magnetic field which is perpendicular to the flow direction. The flow of conductive fluid induces a potential proportional to the average flow velocity, thus requiring the conductivity of the measured flowing liquid to be higher than the minimum conductivity.The induced voltage signal is detected by two electrodes and transmitted to the converter via a cable. After a series of analog and digital signal processing, the accumulated flow and real-time flow are displayed on the display of the converter.

Parameters			
Input			
Measured variable	Direct measured variables ： Flow velocity Calculated measured variables ： Volume flow , mass flow.		
Velocity of flow	Typically Velocity of flow：0.5m/s~5m/s		
Nominal diameter	DN15~DN300		
Flow range	Nominal diameter	Min value (m^3/h)	Max value (m^3/h)
	DN15	0.32	3.2
	DN20	0.56	5.6
	DN25	0.88	8.8
	DN32	1.4	14
	DN40	2.3	23
	DN50	3.5	35
	DN65	6	60
	DN80	9	90
	DN100	14	140
	DN125	22	220
	DN150	32	320
	DN200	56	560
	DN250	88	880
	DN300	127	1270
Range ratio	1:10		
Output			
Current output	Function	Measurement of volume and quality (in the case of constant density)	
	Setting	Scope	(4~20)mA
		Max	20mA
		Min	4mA
	Internal voltage	24VDC	
	Loading	≤750Ω	
Pulse output	Function	Set up Pulse output	
	Pulse output	Basis	Fmax ≤ 5000 cp/s Output pulse width: 0.1ms ~2000ms (This value is lower than the maximum duty cycle, with a maximum duty cycle of 1:1 Fmax ≤ 5000 cp/s)
		Pulse coefficient	0.001~100000/unit
	Passive	U_{Outer}≤ 30VDC	
	Active	$U_{Internal}$ ≤ 24VDC	

	I≤ 4.52mA
Communications	RS485 serial , MODBUS-RTU communication protocol
Power supply	
Supply voltage	100VAC~230VAC，50/60Hz； 20VDC~28VDC
Power consumption	≤15W
Terminals	Screw type terminal block, maximum wire diameter 2.5mm^2
Cable entries	M20*1.5 or NPT1/2
Performance characteristics	
Reference operating conditions	Medium: water Temperature: 20℃ Pressure: 0.1MPa Stallation requirements: Inlet run≥10DN, Outlet run≥5DN
Accuracy	Measurement value±0.5%(Flow velocity 0.5m/s~5m/s)
Repetitiveness	0.16%
Maximum measured error	 ①X[m/s]：Velocity of flow ②Y[%]：Actual measured value deviation
Process	
Medium temperature range	Polyurethane rubber (PU)：-10℃~60℃ Chloroprene rubber (CR)：-10℃~70℃ PTFE/FEP：-10℃~120℃
Pressure rating (High pressure can be customized)	DN15~DN250：PN<1.6MPa DN300：PN<1.0MPa Note：(If there are differences in the selection of individual specifications, the label shall prevail, and high-voltage can be customized)
Conductivity	≥50μS/cm
Environment	
Ambient temperature	-10℃~55℃
Storage temperature	-20℃~55℃
Ingress protection	IP65
Explosion-proof parameters	
Ex symbol	Ex db ib IIC T6...T4 Gb
